

Iterations

Process and Intention

- After hand carving plaster casts to study the interface between hand and handle iteration were modeled digitally in rhino and then 3D printed in PLA plastic until I was satisfied with a final product and finished it with a 2 part 3D print finish. This was then sanded painted covered in a clear coat and a peeling blade was inserted.
- The intention of the piece was to create a peeler whose hand to handle interface was so smooth the user would not be conscious of the way the product fit in their hand when using it.
