

Iterations

Process and Intention

- My goal was to create a salt and pepper shaker that could exist sculpturally both together and isolated who's function would require little to no thought from the user
- After researching the interaction between the object and function and the language by which salt and pepper shakers are defined I began to iterate models.
- My final concept ended up as an attempt to create a salt and pepper shaker that could be used simultaneously with as much ease as they might be able to stand alone.
- The final shape of the porcelain slip cast salt shaker allows the pepper shaker to rest neatly inside without hindering function.
 - The shape and size of the pepper shaker allows it to slip in the side without falling out the top.
